

RAFFI TACHDJIAN, M.D., M.P.H.

KRIKOR MANOUKIAN, M.D.

You are here today to receive a Pneumonia vaccine shot. PNEUMOVAX® 23 is a vaccine indicated for active immunization for the prevention of pneumococcal disease caused by the 23 serotypes contained in the vaccine. PNEUMOVAX 23 is approved for use in persons 50 years of age or older and persons aged 2 years or older who are at increased risk for pneumococcal disease.

There are certain contradictions to this. Please check off the following list so that we may be sure this is a safe procedure for you. Thank you.

- I do NOT have a history of severe allergic reactions (e.g., anaphylaxis) to any component of the vaccine, including phenol or following a previous dose of any pneumonia vaccine.
- I do NOT have severely compromised cardiovascular and/or pulmonary function that may increase the risk of a systemic reaction.
- I have been advised to read the package insert for the flu vaccine.
- I am NOT on immunosuppressive therapy.
- I do NOT have a bleeding disorder.
